### Welcome!

```
# Wifi: Julia's hotspot / FieldSchool

# This is the room for the tidy tools course.

# Please get set up using the instructions at:

# https://github.com/hadley/tidy-tools
```

#### Your turn

This course is hands-on and, while we're here to help, the best resource may be the person sitting next to you.

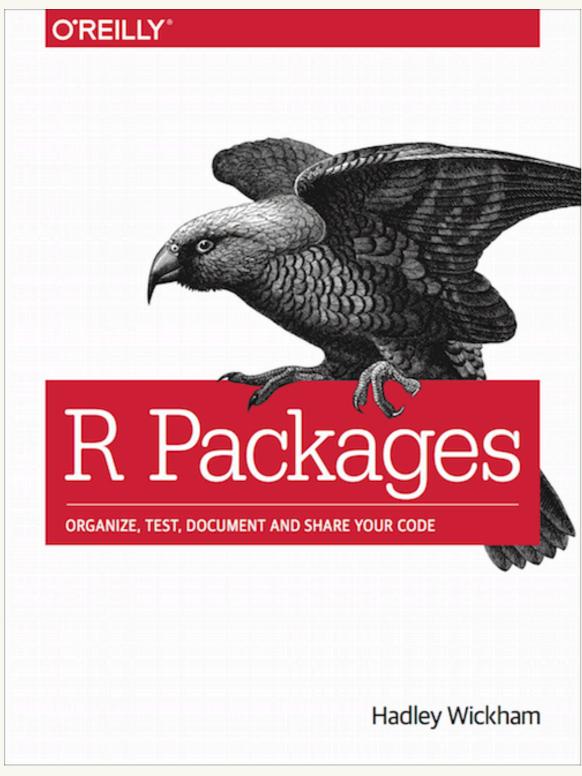

Introduce yourself to your neighbours. Who are you and what are you using R for?

This means that you have to work!

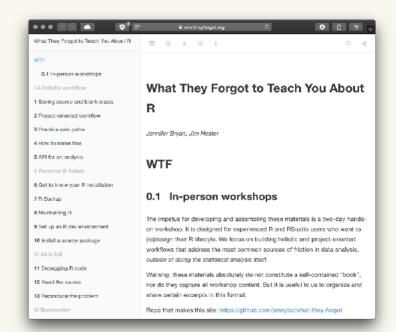

https://github.com/hadley/tidy-tools

### My outline for today

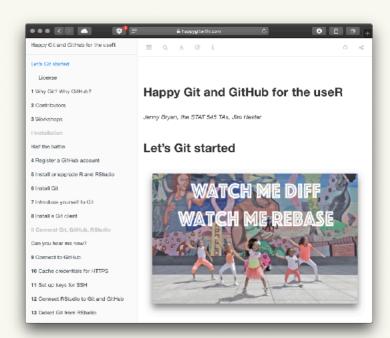

- 1. Intros & warmups
- 2. "The whole game"
- 3. Testing
- 4. Documentation
- 5. Sharing
- 6. Dependencies
- 7. Tidyverse + packages

https://r-pkgs.org/

#### https://rstats.wtf

https://happygitwithr.com

https://github.com/hadley/tidy-tools

### What do you want to learn?

This class is very small so we can customise to what you want to learn more about.

This morning is fairly scripted (because I have slides) but the rest of the time is live coding, so I can be pretty flexible.

I can talk about pretty much anything related to R programming, as long as you don't mind raw explanations.

### Warmup

Getting to know your R installation!

https://github.com/hadley/tidy-tools

```
# How do you install a package from CRAN?
# How do you install a package from GitHub?
```

https://github.com/hadley/tidy-tools

### Handful of ways of installing packages

```
install.packages("devtools")
pak::pkg_install("devtools")
devtools::install_github("r-lib/itdepends")
remotes::install_github("r-lib/itdepends")
pak::pkg_install("r-lib/itdepends")
# What's the difference between devtools
# and remotes?
```

### Your turn

```
# How does installing a package change your
# computer?
# What is a library? How many libraries do you
# have? Which is the default?

.Library
.libPaths()
```

#### Library = directory of R packages

base R =

14 base packages+

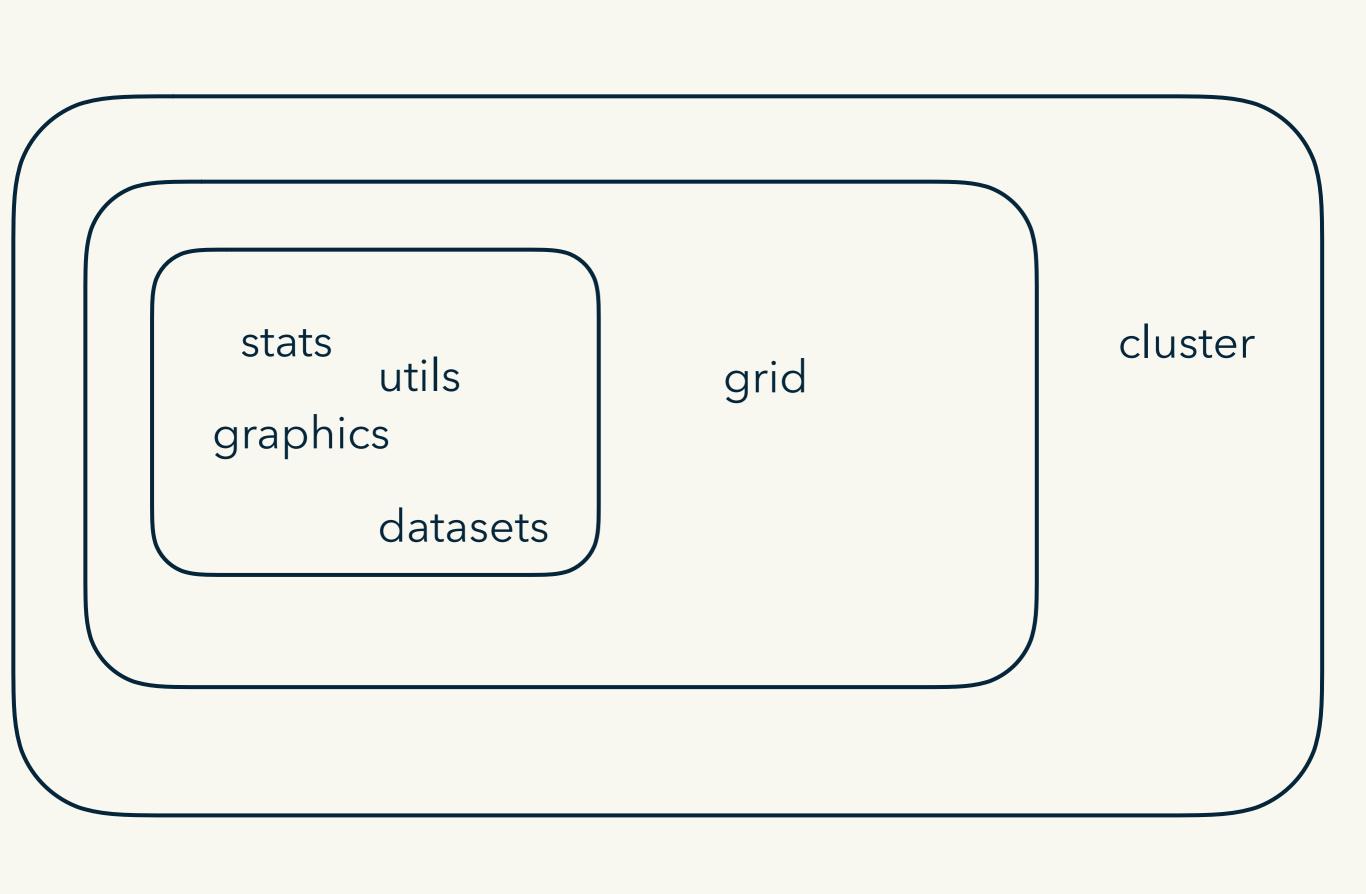

29 recommended (also on CRAN) packages

Automatically installed with R.

#### Your turn

```
# How does running library(dplyr) affect your
 computer? How is it connected to your
# libraries?
# Hint: try comparing this code before and
# after
data.frame(
  env = search(),
  path = searchpaths()
```

https://github.com/hadley/tidy-tools

library(pkg) attaches a package

7 base packages are always attached

Use R --vanilla to check

# The whole game

What follows is adapted from

#### The Whole Game

chapter in the revised version of R Packages.

https://r-pkgs.org/whole-game.html

A proper package for the care and feeding of factors:

#### forcats

https://forcats.tidyverse.org

A package is a set of conventions that (with the right tools) makes your life easier

usethis::create\_package()

### What does create\_package() do?

✔ Creating '/Users/jenny/tmp/foofactors2/' ✓ Setting active project to '/Users/jenny/tmp/foofactors2' ✔ Creating 'R/' ✓ Writing 'DESCRIPTION' Package: foofactors2 Title: What the Package Does (One Line, Title Case) Version: 0.0.0.9000 Authors@R (parsed): \* Jennifer Bryan <jenny@rstudio.com> [aut, cre] Description: What the package does (one paragraph). License: MIT + file LICENSE Encoding: UTF-8 LazyData: true ✓ Writing 'NAMESPACE' ✔ Writing 'foofactors2.Rproj' ✓ Adding '.Rproj.user' to '.gitignore' ✓ Adding '^foofactors2\\.Rproj\$', '^\\.Rproj\\.user\$' to '.Rbuildignore' ✔ Opening '/Users/jenny/tmp/foofactors2/' in new RStudio session ✓ Setting active project to '<no active project>'

## use\_git()

Not going to teach it, but diffs are helpful use\_r()

#### Factors can be vexing

```
(a <- factor(c("character", "in", "the", "streets")))</pre>
#> [1] character in the streets
#> Levels: character in streets the
(b <- factor(c("integer", "in", "the", "sheets")))</pre>
#> [1] integer in the sheets
#> Levels: in integer sheets the
c(a, b)
#> [1] 1 2 4 3 2 1 4 3
```

#### Factors can be vexing

```
factor(c(as.character(a), as.character(b)))
#> [1] character in the streets integer in
#> [7] the sheets
#> Levels: character in integer sheets streets the
```

Let's turn this into our first function: fbind()

#### Where do we define functions?

```
Beautiful pairing:
                         use_r() & use_test()
# There's a usethis helper for that too!
usethis::use_r("file-name")
# Organise files so that related code
# lives together. If you can give a file
# a concise and informative name, it's
# probably about right
```

# Now what?

source("R/fbind.R")

Use IDE tricks to send definition of fbind() to the R Console

# Now what?

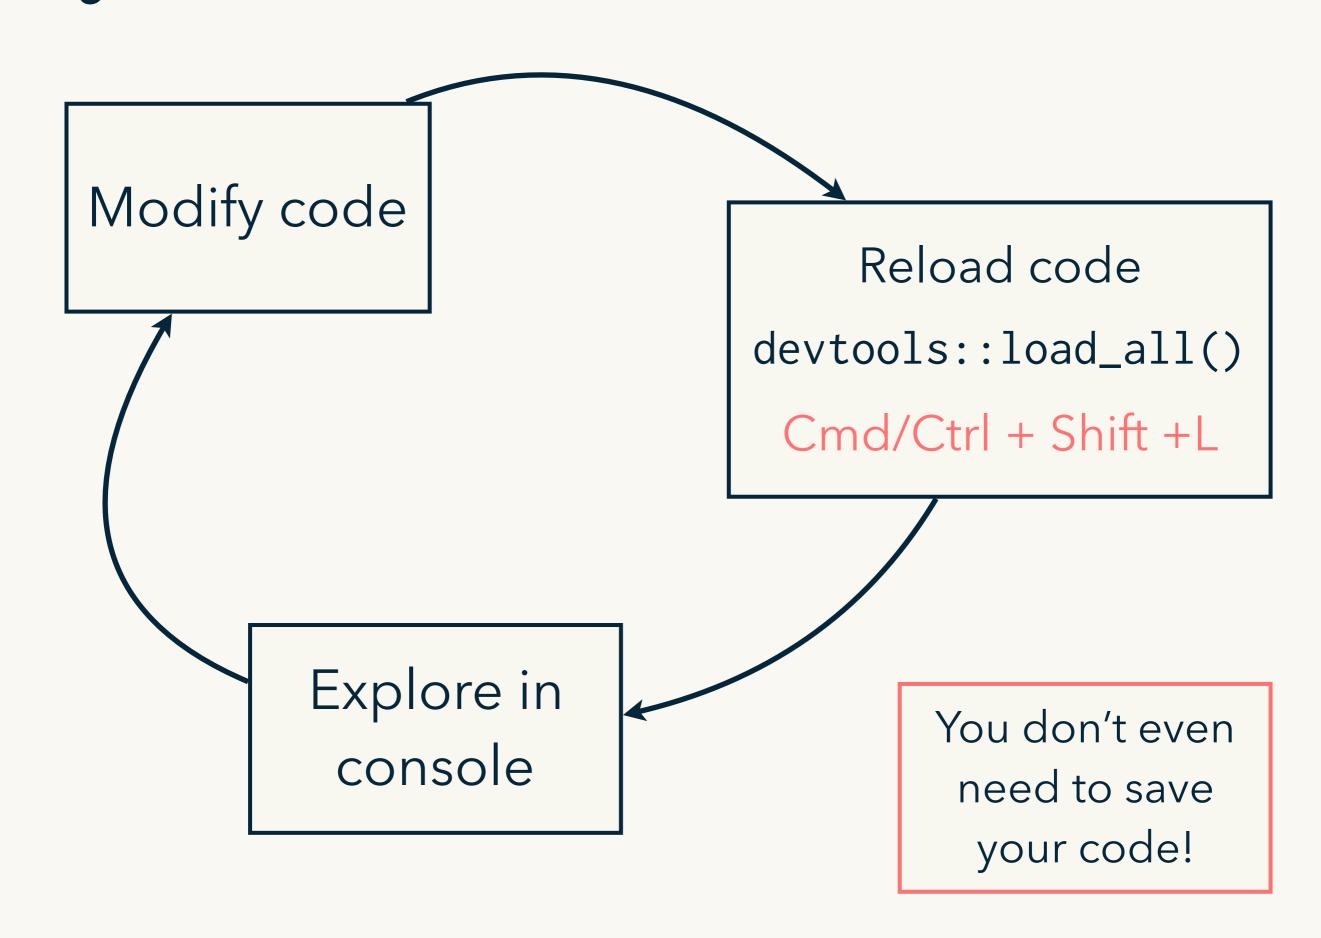

source("R/fbind.R")

Use IDE tricks to send definition of fbind() to the R Console

devtools::load\_all()

### devtools::load\_all()

#### Why do we love devtools? Workflow!

Important metadata files exist in all versions

In binary versions, documentation is compiled into multiple versions. A parsed version of DESCRIPTION is cached for performance.

In binary versions, R/ no longer contains .R files, but instead contains binary .Rdata files

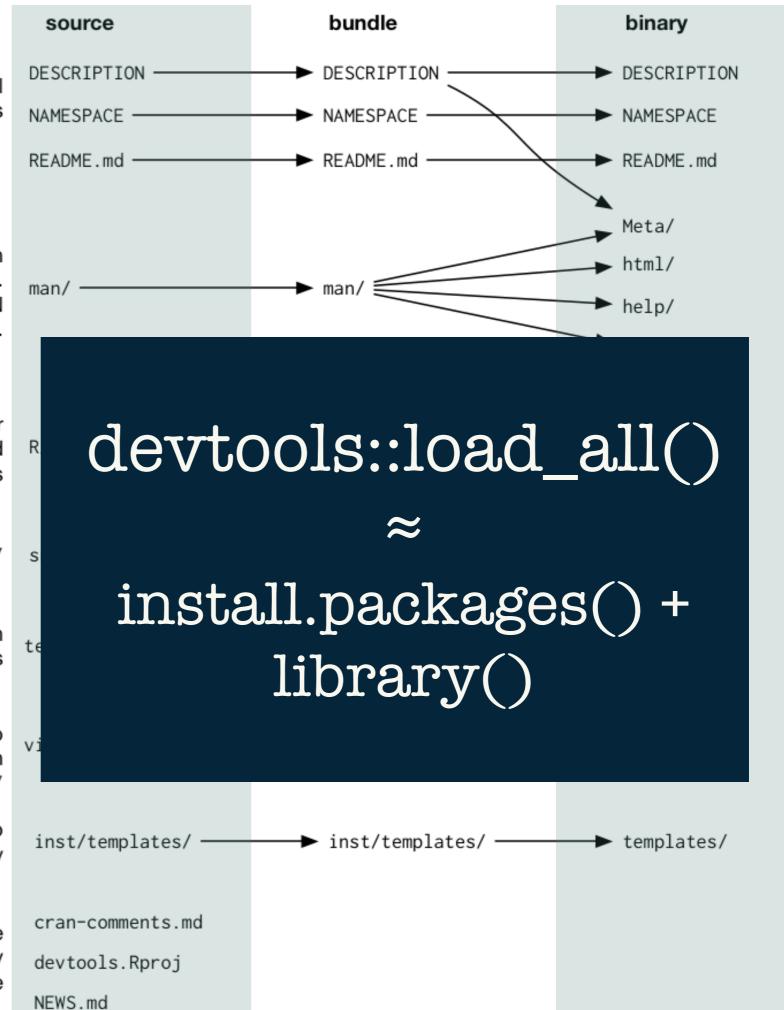

Compilation results are saved in libs/

By default, tests are dropped in binary packages

Source vignettes are build into html or pdf in inst/doc, then installed into doc/

The contents of inst/ are moved into the top-level directory

Files used only for development are listed in .Rbuildignore, and only exist in source package

## devtools::check()

### check() ≈ R CMD check

Checks package for technical validity

Defree B. (or B. Ctrl. (or defined a chiff a ch

Do from R (or RStudio Ctrl/cmd + shift + e)

check() early, check() often

Get it working, keep it working

Necessary (but not sufficient) for CRAN

Excellent way to run your tests (and more)

# devtools::document()

#### roxygen2 turns comments into help

```
#' Bind two factors
# '
  Create a new factor from two existing factors, where the new
  factor's levels are the union of the levels of the input
  factors.
# '
                                            RStudio helper:
  @param a factor
  @param b factor
                                     Code > Insert roxygen skeleton
# '
  @return factor
  @export
  @examples
#' fbind(factor(letters[1:3]), factor(letters[26:24]))
fbind <- function(a, b) {
  factor(c(as.character(a), as.character(b)))
```

## devtools::check()

# devtools::install()

### install() ≈ R CMD install

- Makes an installed pkg from your source pkg
- Do from R (or RStudio Install and Restart)
- install() less often than you load\_all() or check()
- Marks transition from developing your package to using your package

### Your turn

# R/RStudio setup

## Workflow setup: your .Rprofile

```
# Setup code that is run at R startup:
# usethis::edit_r_profile()
# Helper to add devtools specifically:
# usethis::use_devtools()
                                devtools makes
                              usethis available too!
if (interactive()) {
  suppressMessages(require(devtools))
  suppressMessages(require(testthat))
```

## Never include analysis packages here

```
if (interactive()) {
   suppressMessages(require(ggplot2))
   suppressMessages(require(dplyr))
}
```

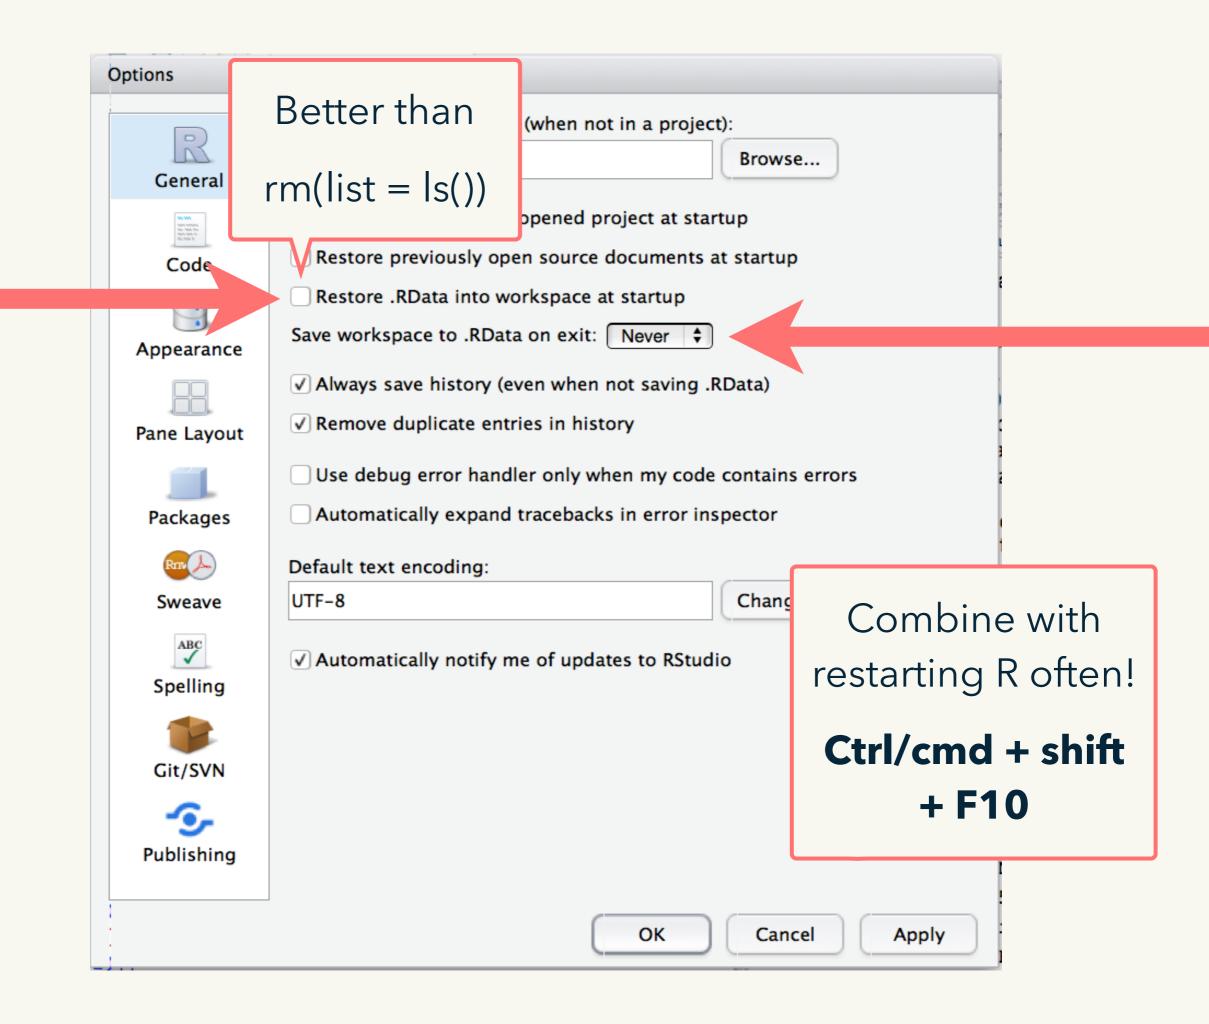

## While you're in there, also add:

```
# Helper to add devtools specifically:
# usethis::use_partial_warnings()
options(
  warnPartialMatchArgs = TRUE,
  warnPartialMatchDollar = TRUE,
  warnPartialMatchAttr = TRUE
```

# Tell usethis about yourself

```
options(
  usethis.full_name = "Hadley Wickham",
  usethis.description = list(
     `Authors@R` = 'person(
         "Hadley", "Wickham", \( \frac{Your first and last names}{\)
         email = "hadley@rstudio.com",<</pre>
                                                  Your email
         role = c("aut", "cre"), < Leave as is
         comment = c(ORCID = "YOUR-ORCID-ID")
            Delete this line if you don't have an ORCID
```

https://usethis.r-lib.org/articles/articles/usethis-setup.html

## Set up your computer

```
edit_r_profile()
```

Load devtools & usethis

Set partial matching warnings

Tell usethis about yourself

In RStudio settings:

Don't save or reload your environment

(See details in slides at https://github.com/hadley/tidy-tools/)

# Make a package!

https://r-pkgs.org/whole-game.html

#### Beware!

You're probably used to maintaining a .R file containing snippets of code that you use to automate various bits of your workflow.

#### Don't save this in R/!

What happens if you have load\_all() inside a file inside of R/? What happens if you have usethis::edit\_r\_profile()?

Where should you save it? 💜 I use Untitled 🙂

Substitute your preferred location.

# Create a package with:

usethis::create\_package("~/Desktop/foofactors")

```
# Notice that you're now in a new RStudio
# instance.
# Continue on through the next slides to
# repeat the actions I showed you.
```

# Stuck? Raise a pink post it

Use usethis::use\_r("fbind") to create a new file In it, define a function named "fbind" that combines its inputs (presumably factors) like so:

- coerce each input to character
- combine inputs
- make output a factor

factor(c(as.character(a), as.character(b)))

Check that you can devtools::load\_all()

Add docs for fbind() as a roxygen comment

- RStudio helper: Code > Insert roxygen skeleton
- Lines MUST start with #'

document()

Makes an .Rd file from the comment

Preview with ?fbind

check() again and ... rejoice!

Problems? Raise a pink post-it

Setup R and RStudio

Edit DESCRIPTION (optional)

- Make yourself the author
- Update Title and Description

Nice to do, but skippable.

use\_mit\_license("Your Name")

Fixes 1 of our 2 warnings.

check() again, if you wish

Confused? Hoist your pink post-it

### Install your foofactors package

- Call install() in R
- RStudio Build & Restart
- Shell: R CMD build + R CMD install

#### Restart R

Attach like a "regular" package with library()

Call fbind()

Revel in your success by raising your green post-it

```
usethis::create_package()
usethis::use_r()
devtools::load_all()
devtools::check()
usethis::use_mit_license()
devtools::document()
devtools::install()
```
